Date of issue of the report	05-07-2013	**Date of the test**	05-07-2013
Test carried out	Measurement of the casing leakage of a damper or valve		
References	NBN EN 1751:1999 Ventilation for buildings - Air terminal devices - Aerodynamic testing of dampers and valves		

This test report contains 5 pages and may only be reproduced in its entirety.
Each page of the report has been stamped (in red) by the laboratory and initialed by the head of laboratory.
The results and findings are only valid for the tested samples.

☐ *No sample*
☐ *Sample(s) subjected to destructive test*
☒ *Sample(s) to be removed from our laboratories 30 calendar days after sending of the report,* save in the case of a further written request.

In charge of the tests
Philippe Voordecker

Head of laboratory
Christophe Delmotte, Ir.

Test procedure

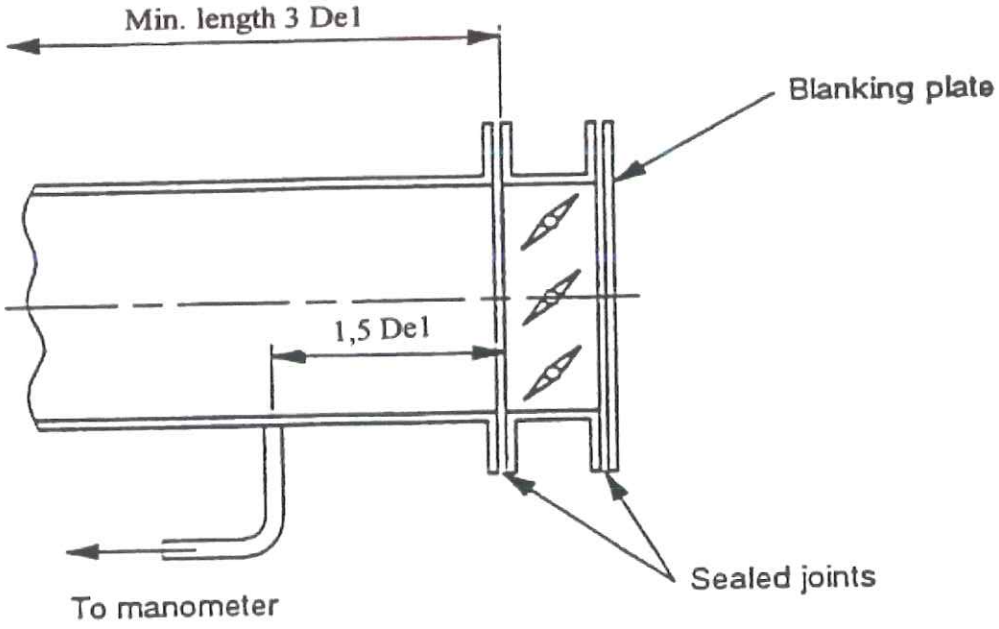
The determination of the casing leakage of a damper or valve is carried out according to NBN EN 1751:1999 «Ventilation for buildings - Air terminal devices - Aerodynamic testing of dampers and valves».

The test installation comprises the following:
- an adjustable air supply incorporating an air flow rate measuring device;
- a pressure measuring device;
- an airtight test duct which supports the damper or valve subjet to the test;
- a blanking plate for the damper or valve.

The test is carried out by subjecting the casing of the damper or valve to a pressure of 2000 Pa. The pressure is then lowered in stages. The air flow rate is recorded at each of the pressure stages.

If temperature and barometric pressure are different from the standard conditions (20 °C and 101325 Pa), the measured airflows are corrected accordingly.

Normalized values are determined through a linear regression.



Principle of test installation according to NBN EN 1751:1999

Description of the sample
Iris damper with a nominal diameter of 125 mm (IRIS-125)

Measuring devices:	Calibration:	Organization:
Platon GTLK	22/05/1989	Platon
